02 Problem Statement

Defect classification of Aluminium 5083 TIG welding

Analyze image data to find the weak points in the industrial process

Identify improvement actions in production process early stage

Classical methods are not suited for the task because time-consuming

Hybrid quantum algorithms

Accelerate the process of defective parts detection by means of hybrid QC

Compare different approaches

Contribute to QC algorithms benchmarking

03 Our Solution in 5 Steps

PennyLane Codebook

Familiarity with PennyLane, basic and more advanced

Variational classifier

Familiarity with QML

Focus on variational quantum classifier circuits to classify new data samples

Quantumvolutional NN

Feature extraction from input data

Computational efficiency Ability to handle complex data

Learn the sine function

Exploit quantum dropout

Avoid overfitting during regression of sinusoidal function noisy data

Real data

Use data from industry

Implement a QML model to detect a defective production part.

04 Success

New Python skills

Preprocessing of Image Data
and resize/reshape

Conspicuity detection

Application of Quanvolutional
NN with 3x3 quantum filter

Better results with
Quanvolutional NN 2x2

New challenges

Tentative application of
Variational classifier. Partial
results
Unsupervised learning model

New knowledge earned

Valuable opportunity to
approach QC and QML

New way of learning

Efficient learning while
performing the assignments

Huge field of application

We make treasure of what
Womanium Quantum program
offered us!

05 Future Scope

Delving into QML

This project was an appetizer on QML topics.

We are motivated to explore
More methods and more ideas

Unsupervised learning

We would like to build a
workflow for unsupervised
learning around this dataset

Scalability

We are interested in seeing what
methods are scalable beyond
the ten qubit limit

Having fun

We did have a lot of fun during
the Womanium Quantum +AI
Project!
Thank you all!

Thanks!
